

give me the powershell commands to update my codex app and codex in cursor to the latest version to accept 5.6 sol and other models

Worked for 42s >

Run in PowerShell

Close **Cursor**, **Codex/ChatGPT desktop**, and any active Codex terminals first.

1. Update package sources

</> PowerShell

```
winget source update
```

2. Update the Codex/ChatGPT Windows app

Codex is now integrated into the current ChatGPT desktop app.

OpenAI Help C... +1

</> PowerShell

```
winget upgrade `
  --id 9NT1R1C2HH7J `
  --source msstore `
  --accept-package-agreements `
  --accept-source-agreements
```

If it reports that the application is not installed:

</> PowerShell

```
winget install `
  --id 9NT1R1C2HH7J `
  --source msstore `
  --accept-package-agreements `
  --accept-source-agreements
```

The Microsoft Store package ID above is the official OpenAI Windows package.

OpenAI Help C...

3. Update Cursor itself

</> PowerShell

```
winget upgrade `
  --exact `
  --id Anywhere.Cursor
```

```
--accept-package-agreements `
--accept-source-agreements
```

If Winget cannot match your existing Cursor installation:

PowerShell

```
winget install `
  --exact `
  --id Anysphere.Cursor `
  --force `
  --accept-package-agreements `
  --accept-source-agreements
```

Cursor's current Windows release is **3.10** as of July 10, 2026.  Cur...

4. Update the Codex CLI

PowerShell

```
npm install --global @openai/codex@latest
```

Verify which executable is being used:

PowerShell

```
Get-Command codex -All
codex --version
npm list --global @openai/codex --depth=0
```

If `npm` fails because Node.js is outdated:

PowerShell

```
winget upgrade --exact --id OpenJS.NodeJS.LTS
```

Restart PowerShell, then repeat:

PowerShell

```
npm install --global @openai/codex@latest
```

5. Force-update the official Codex extension inside Cursor

The official extension identifier is currently `openai.chatgpt`, despite the displayed product name being **Codex**.  Visual Studio M...

<> PowerShell

```
$Cursor = @(
    (Get-Command cursor -ErrorAction SilentlyContinue).Source
    "$env:LOCALAPPDATA\Programs\cursor\Cursor.exe"
    "$env:ProgramFiles\Cursor\Cursor.exe"
) | Where-Object {
    $_ -and (Test-Path $_)
} | Select-Object -First 1

if (-not $Cursor) {
    throw "Cursor executable was not found."
}

& $Cursor --install-extension openai.chatgpt --force
& $Cursor --list-extensions --show-versions |
    Select-String "^openai\.chatgpt@"
```

6. Change your Codex default from GPT-5.5 to GPT-5.6 Sol

Your CLI and Cursor Codex extension share:

C:\Users\<username>\.codex\config.toml

The desktop app, CLI, and IDE extension use the same Codex configuration.

 OpenAI Develo...

Use this command to back up the file and change only the model line:

<> PowerShell

```
$ConfigPath = Join-Path $HOME ".codex\config.toml"
$BackupPath = "$ConfigPath.backup.$(Get-Date -Format 'yyyyMMdd-HH:mm:ss')"

Copy-Item $ConfigPath $BackupPath -Force

$Config = Get-Content $ConfigPath -Raw

if ($Config -match '(?m)^\s*model\s*=') {
    $Config = $Config -replace '(?m)^\s*model\s*=.*$', 'model = "gpt-5.6-sol"'
}
else {
    $Config = "model = `n" + "gpt-5.6-sol`n" + $Config
}

Set-Content `
    -Path $ConfigPath `
    -Value $Config `
    -Encoding utf8
```

```
Get-Content $ConfigPath |  
    Select-String '^(model|model_reasoning_effort)\s*='
```

Your existing setting can remain:

</> TOML

```
model_reasoning_effort = "xhigh"
```

7. Test each GPT-5.6 model directly

</> PowerShell

```
codex -m gpt-5.6-sol
```

</> PowerShell

```
codex -m gpt-5.6-terra
```

</> PowerShell

```
codex -m gpt-5.6-luna
```

The current official model identifiers are:

Model	Identifier	Recommended use
GPT-5.6 Sol	<code>gpt-5.6-sol</code>	Hard, ambiguous, high-value work
GPT-5.6 Terra	<code>gpt-5.6-terra</code>	Everyday coding and agent work
GPT-5.6 Luna	<code>gpt-5.6-luna</code>	Fast, repeatable, lower-cost tasks

Codex also accepts the general alias:

</> PowerShell

```
codex -m gpt-5.6
```

OpenAI currently documents Sol, Terra, and Luna as available across the Codex CLI and IDE extension.  OpenAI Develo...

Recommended final configuration

</> TOML

```
model = "gpt-5.6-sol"  
model_reasoning_effort = "xhigh"  
personality = "pragmatic"  
project_doc_max_bytes = 65536
```

After updating, restart Windows or at minimum restart **Cursor**, **ChatGPT/Codex**, and **PowerShell**, then sign out and back into the Codex extension if GPT-5.6 still does not appear. Updating the software enables support, but the displayed model list can also depend on account authentication, plan eligibility, workspace policy, and server-side rollout.
